Product and Spatial Design

The main interest in the two year's Master's Degree programme in Product and Spatial Design is the relationship between spaces and objects. The objective is to add student's sensitivity and understanding of the built environment. Ideally the designer can operate as an interpreter between the material world and human aspirations. The atmospheric qualities in spaces and products are even more important than the functional aspects.

Our study method is based on the experimentation. We work in different scales related to human being starting from urban scale and ending to the 1:1 scale. The pragmatic and theoretical skills of the discipline are learned individually and in groups through different case studies. There is respect for the student's own personal insight and individuality instead of offering them programmatic declarations. We encourage them to find their own voice.
